

## Successful completion of critical network project

07 October, 2007

CNS today announced that it has successfully completed a Network Resiliency Project for a UK TV Company. CNS were engaged to design and implement a resilient 'collapsed backbone' network using Cisco Catalyst 4500 distribution switches and Cisco Catalyst 3560 (PoE) access switches for 300 users. This deployment within a critical network environment was a great success and has brought about improved network performance and resiliency for all users.
